

To whom it may concern

Taratahi Agricultural Training Centre in Masterton recently purchased a paraffin dipper from Hive World. We have now used the dipper for three workshops and we have been very pleased with the results.

The Dipper is designed for safety and the features that we found most valuable is the lids which allow the hive ware to be attached and secured and then closed down inside the Dipper while the hive box is submerged in paraffin. This feature ensures our students are as safe as possible and they cannot be splashed with wax while learning this process which is new to them.

Having this design of Paraffin Dipper means we can allow our students more independence during the process they can take part fully and focus on their learning. I am sure that the learning experience is more effective and enjoyable because of this.

The paraffin wax dipping tank is designed to paraffin dip hive boxes in a safe manner. It includes a built-in shelf for two gas rings underneath and a skirt around the base and is fully insulated with a built in temperature gauge. It also has a valve at the base for draining and an overflow pipe as a safety precaution in case of boil over.

The unit we purchased is fitted with 4 x wheels - 2 x fixed and 2 x swivel with brakes which means we can easily wheel it to the most suitable area for our operation and store it away again afterwards.

Thank you Hive World
